## **Project BudBurst's Urban Tree Phenology Program**

The Urban Tree Phenology Program works to engage researchers, professionals, and the public to raise awareness in urban forestry issues, encourage scientific literacy, and generate useful data. Using the program's online system, participants collect and report phenological data for trees in urban areas. The data is then logged and can be used for research purposes and practical applications. The program is an effort to connect scientific processes with urban forestry professionals and the public. It operates within Project BudBurst, which is a scientific field campaign for community members. The Urban Tree Phenology Program is also supported by the USDA Forest Service's Urban and Community Forestry.
